Index to the Length of Stay Tables

If an operation does not appear in the Index, its corresponding *ICD-9-CM* code can be found in the *International Classification of Diseases, 9th Revision, Clinical Modification,* Volume 3, Procedures: Tabular List and Alphabetic Index, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978. The operation group containing the *ICD-9-CM* code can then be located in the length of stay tables.

OPERATION INDEX

This operation index lists common operations and gives the number of the *ICD-9-CM List B* operation group to which each operation belongs.

PREFACE

This book is one volume of a set of 14 books presenting statistics on hospital stay during 1984 in North America. The complete set is the latest in a series of publications on length of stay in hospitals that participate in the Professional Activity Study (PAS) of the Commission on Professional and Hospital Activities. Several organizations have contributed data to CPHA from other abstracting services. Some of those data were included in the 1984 series.

These statistics, which are also available on computer-readable magnetic tape, can provide a valuable perspective for physicians, administrators, utilization review authorities, and planners who make decisions based on length of hospitalization. They can also serve as an aid in establishing check points for "continued stay review" and in the implementation or revision of utilization review systems.

We extend our appreciation to the hospitals and state organizations that supported this study by making their data available.

DISCUSSION OF THE DATA

Source of the Data

Data in the length of stay books were compiled from individual patient discharge records submitted by hospitals participating in the Professional Activity Study (PAS) of the Commission on Professional and Hospital Activities (CPHA). In addition, some books contain discharge data from hospitals participating in information systems other than PAS.

CPHA is an organization dedicated to the improvement of hospital and medical care through research, education, publishing, and systems development. Established in 1955 under grants from the W.K. Kellogg Foundation, CPHA is nonprofit, nongovernmental, noncommercial. CPHA is sponsored by the American College of Physicians, the American College of Surgeons, the American Hospital Association, and the Southwestern Michigan Hospital Council.

The following steps explain the PAS method of storing and retrieving medical data:

1. In each participating hospital, personnel transfer data from the medical record of each discharged patient into the PAS System via PAS+ microcomputer, PAS Case Abstract, or magnetic tape.

2. The disk, abstract, or tape is mailed to the center of PAS operations in Ann Arbor, Michigan, where it is entered into the computer system.

3. Data then undergo a comprehensive editing process and errors are corrected by CPHA and contributing hospitals.

4. The computer system continually adds data to the permanent history file. Participating hospitals are provided access to these data through interactive systems, reports, and in-house computers. The stored data are also available to researchers on a contractual basis.

5. Length of stay statistics from this file are published annually in this series of books.

Data Quality

Data quality has always been and remains one of CPHA's major concerns. Although the hospital has basic responsibility for the quality of PAS data, CPHA shares that responsibility in its function as an extension of the hospital's medical information network. CPHA's position of leadership in health information processing systems and data usage necessitates a constant striving for data accuracy.

CPHA goes to considerable length to prevent and correct errors in data submission by training hospital medical record personnel in coding and abstracting methods, by monitoring submitted data, and by meticulously checking and editing the data for errors. Over 350 checks are performed during the processing of each record to ensure the reasonableness of the data received. Examples of discrepancies in the data that are detected by the audit are: hospital day of operative episode exceeding total stay, cesarean section with a normal delivery diagnosis, a sex-specific diagnosis or operation with the wrong sex recorded, incalculable age or stay, unrecorded or invalid diagnosis. When illogical, invalid, or missing data are detected, about 40 percent of the errors are corrected by the computer. The remainder are referred to the hospital staff through error messages generated by the computer.

In addition to the initial data editing, the computer system that produces the length of stay tables does numerous edits to eliminate uncorrected or unusual data. The following events noted on a record cause that record to be excluded:

1. death
2. stillborn
3. admitted from other short-term hospital
4. discharged to other short-term hospital
5. discharged against medical advice
6. length of stay greater than 99 days (included only in the percentile calculations)

These patient records were excluded because they do not represent typical short-term patients. Data that pass all the edits represent patients whose length of stay was solely determined and managed by the physician.

Coverage

Data chosen for inclusion in the length of stay series are from general, non-federal, short-term hospitals in the United States. Short-term hospitals are defined as those in which the median stay is shorter than 30 days. The map indicates the boundaries of the regional books.

Most of the data used in the length of stay book series are from short-term, general hospitals participating in PAS through CPHA. In addition, the following organizations have sent data to CPHA: Alabama Hospital Association, Colorado Hospital Association, Illinois Hospital Association, Kaiser Foundation Hospitals, Kansas Hospital Association, Maine Hospital Association, Michigan Health Data Corporation, Missouri Health Data Corporation, The National Association of Children's Hospitals and Related Institutions, Inc. (NACHRI), Oregon Hospital Association, Sisters of Mercy Health Corporation (SMHC), Utilization Information Service of the Hospital Association of New York State, and the Vermont Hospital Association. Several individual hospitals throughout the United States have also sent data to CPHA for special studies. These contributed data expand CPHA as a national health information center. The cooperation of these organizations is appreciated.

Hospitals participating in PAS from United States Territories and Puerto Rico were excluded from the series. Data from psychiatric hospitals were excluded because the psychiatric hospitals are not general hospitals. Data from psychiatric units within general hospitals were included. Pediatric hospitals were also included.

Characteristics of all the hospitals with data included in the length of stay books are displayed on the following page.

Organization of Length of Stay Tables

The length of stay tables are organized according to CPHA's cross classification, a patient classification system similar to Diagnosis Related Groups (DRGs). The diagnosis classification system is called *ICD-9-CM List A: Hospital Diagnosis Groups.*[1] Within each procedure group, patients are further stratified by single or multiple diagnoses and age. For diagnosis groups 393-395, which pertain exclusively to newborn, age is replaced by birthweight in grams as a means of stratifying patients. The operated classification system is called *ICD-9-CM List B: Hospital Procedure Groups.* Within each procedure group patients are further stratified by single or multiple diagnoses and age.

Patient data were assigned *ICD-9-CM List A* groups on the basis of the principal diagnosis. This is the diagnosis that after study explains why the patient was admitted to the hospital. Patient data were assigned *ICD-9-CM List B* groups on the basis of the principal procedure. "Principal procedure" is an item in the Uniform Hospital Discharge Data Set (UHDDS)[2] and generally is that therapeutic procedure most related to the principal diagnosis. Diagnosis and procedure information for all patient data included in this book was coded using *ICD-9-CM.*

Definition of Multiple Diagnosis Patients

Patients are classified in the multiple diagnosis category if they had at least one valid secondary diagnosis in addition to the principal. The following codes are not considered valid secondary diagnoses for purposes of this classification:

1) Manifestation codes (conditions that evolved from underlying diseases [etiology] and are in italics in *ICD-9-CM Volume 1*[3])
2) Codes V27.0-V27.9 (outcome of delivery)
3) E codes (external causes of injury and poisoning)

Definition of Operated Patients

In the diagnosis tables, operated patients are patients who had at least one UHDDS Class 1 procedure. Patients with only Class 2-4 procedures are considered nonoperated. In the procedure tables, operated patients are those whose principal procedure was grouped into an *ICD-9-CM List B* number where at least one UHDDS Class 1 procedure was present. While most *List B* groups contain only Class 1 procedures, the following groups contain Class 1 procedures and at least one procedure that is Class 2-4: 548, 557, 575, 576, 587, 609, 615, 619, 626, 630, 636, 646, 654, 666, 679, 682, 686, 690, 696, 706, 758, 760, 764.

Explanation of Statistics

The *List A* diagnosis group titles and *List B* procedure group titles heading the tables are followed in parentheses by the *ICD-9-CM* diagnosis or procedure codes included in that *List A* or *List B* group.

Length of stay was calculated by the computer from admission and discharge dates by counting the day of admission but not the day of discharge. Patients discharged on the day of admission were counted as staying one day in the calculation of average stay and variance but as staying less than one day in the calculation of the percentiles. Thus, if more than 5 percent of the patients in a cell (one line of data within a table) were discharged on the day of admission, the 5th percentile is shown as "<1."

Patients who were hospitalized 100 days or longer are not included in Number of Patients, Average Stay, or Variance. The percentiles shown in columns 5 through 11, however, do include these patients.

The variance displayed is an unbiased estimate of the mean squared deviation from the average. For each cell it is calculated as $\sum_{i=1}^{N} (X_i - \overline{X})^2/(N - 1)$, where the X_i's are the length of stay for each patient, $\overline{X}$ is the average stay in the cell, and N is the number of patients in the cell.

The 5th, 10th, 50th, 75th, 90th, 95th, and 99th percentiles of stay are displayed in days. If, for example, the 10th percentile for a group of patients is four, it means that 10 percent of the patients stayed four days or less. The 50th percentile is the median. Any percentile with a value of 100 days or more is listed as 99+.

Determining a stay percentile for a group of patients is done by arranging the individual patient stays from low to high. Counting up from the lowest stay to the point where half of the patients have been counted yields the value of the 50th percentile. Counting off one-tenth of the total patients gives the 10th percentile, and so on.

Defining the Extende[illegible] Case

Concurrent review of a continuous hospital stay that equals or exceeds the period defined in the hospital's utilization review plan or memorandum of understanding with the utilization review authority is called extended stay review. This review, whether applied universally to all patients within the facility or focused on known or suspected problem areas, is designed to answer the following question: Is further hospitalization medically necessary?

Ideally, this question is posed at that point in the patient's hospitalization which is neither so early as to be annoyingly pointless nor so late that opportunity for cost containment has passed. The median (50th percentile) stay for similar patients, as reflected in current length of stay tables, represents an effort to arrive at a sensible compromise as to the "correct" day on which to initiate the review process.

To satisfy the requirements for extended stay review, a method of defining an extended stay must begin with a definition of factors that affect stay. Presented here is a technique for determining extended stay review dates according to the admitting diagnosis, whether the patient had single or multiple diagnoses, whether the patient had an operation, and the patient's age. In some instances it is appropriate to determine the date for extended stay review by referring to an operation table rather than one based on the diagnosis.

An extended stay review date can be projected for each patient at the time of admission to the hospital by using one of the length of stay books published by CPHA. With the appropriate book, the six steps to determine a review date are as follows:

Step 1. Find the length of stay diagnosis or procedure group (derived from the *ICD-9-CM List A: Hospital Diagnosis Groups* or *ICD-9-CM List B: Hospital Procedure Groups*[1]) that contains the admission diagnosis or principal procedure in one of the following ways:

a. Usually the diagnosis can be found in *Concurrent Review Screening,*[2] developed for admission certification and extended stay review purposes, in which diagnoses are listed alphabetically. The length of stay group for each diagnosis is given in column 4.

b. Diagnoses or procedures can also be found in the Alphabetic Indexes at the back of the length of stay books.

[2] *Concurrent Review Screening—Criteria for Hospital Admission and Assignment of Length of Stay,* Second Edition, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

c. If a diagnosis is not listed in the index to the length of stay tables, the code for the diagnosis can be found in Volume 2 of *ICD-9-CM.*[1] That code can then be located in *List A* or in the heading of the length of stay table. Operated codes can be found in *ICD-9-CM,* Volume 3.

d. If a diagnosis is not clearly specified and therefore might fall into one of several diagnosis groups, the attending physician should be consulted.

Step 2. Find the appropriate table in the length of stay book. The group number precedes the title of each table.

Step 3. Find the appropriate part of the table for single or multiple diagnoses.

Step 4. If surgery is planned, find the applicable section for operated patients. For some diagnoses two or more operations with widely different lengths of stay could be performed, e.g., primary malignancy of trachea, bronchus, and lung, where the planned operation may be either bronchoscopy or a major lung resection. The second edition of *Concurrent Review Screening* directs the UR coordinator to the appropriate operation length of stay table.

Step 5. Determine the patient's age on day of admission and locate the correct age group to find the appropriate cell.

Step 6. Find the 50th percentile of stay for similar patients at the point where the 50th percentile column (column 7) of the table intersects the horizontal line that includes the pertinent variables for the patient having an extended stay review date assigned.

Example: On 3 November a 67 year old patient is admitted to a hospital for elective surgery. The admitting diagnosis is cholelithiasis and no secondary diagnoses are recorded. The following illustrations show the six steps for finding the date on which the patient becomes an extended stay case and must be reviewed.

Step 1. The length of stay group can be found in any of the following ways:

a. Cholelithiasis is listed as a diagnosis in *Concurrent Review Screening.* The length of stay table is number 215.

The patient was admitted on 3 November; therefore, the eighth day will fall on 11 November. Prior to or on 11 November the groups responsible for conducting extended stay review will make a finding as to whether further stay is medically necessary.

In the above example, the stay percentile used to define extended stay was the 50th percentile (column 7). If, based on the initial review, the patient's stay in the hospital was approved for extension beyond the 50th percentile, the date for the second extended stay review is determined in accordance with the hospital's plan, e.g., the 75th percentile.

Subsequent extended stay review dates should be set by the physician advisor or the utilization review committee as necessary based on the patient's medical condition and the attending physician's evaluation of the patient's progress.

Index

Part 1: Diagnosis Index
Part 2: Operation Index

If a diagnosis or operation does not appear in the Index, its corresponding *ICD-9-CM* code can be found in the *International Classification of Diseases, 9th Revision, Clinical Modification,* Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978, Volume 2 Diseases: Alphabetic Index or Volume 3 Procedures: Tabular List and Alphabetic Index. The diagnosis or operation group containing the *ICD-9-CM* code can then be located in the length of stay tables.

PREFACE

This book is one volume of a set of 14 books presenting statistics on hospital stay during 1984 in North America. The complete set is the latest in a series of publications on length of stay in hospitals that participate in the Professional Activity Study (PAS) of the Commission on Professional and Hospital Activities. Several organizations have contributed data to CPHA from other abstracting services. Some of those data were included in the 1984 series.

These statistics, which are also available on computer-readable magnetic tape, can provide a valuable perspective for physicians, administrators, utilization review authorities, and planners who make decisions based on length of hospitalization. They can also serve as an aid in establishing check points for "continued stay review" and in the implementation or revision of utilization review systems.

We extend our appreciation to the hospitals and state organizations that supported this study by making their data available.

DISCUSSION OF THE DATA

Source of the Data

Data in the length of stay books were compiled from individual patient discharge records submitted by hospitals participating in the Professional Activity Study (PAS) of the Commission on Professional and Hospital Activities (CPHA). In addition, some books contain discharge data from hospitals participating in information systems other than PAS.

CPHA is an organization dedicated to the improvement of hospital and medical care through research, education, publishing, and systems development. Established in 1955 under grants from the W.K. Kellogg Foundation, CPHA is nonprofit, nongovernmental, noncommercial. CPHA is sponsored by the American College of Physicians, the American College of Surgeons, the American Hospital Association, and the Southwestern Michigan Hospital Council.

The following steps explain the PAS method of storing and retrieving medical data:

1. In each participating hospital, personnel transfer data from the medical record of each discharged patient into the PAS System via PAS+ microcomputer, PAS Case Abstract, or magnetic tape.

2. The disk, abstract, or tape is mailed to the center of PAS operations in Ann Arbor, Michigan, where it is entered into the computer system.

3. Data then undergo a comprehensive editing process and errors are corrected by CPHA and contributing hospitals.

4. The computer system continually adds data to the permanent history file. Participating hospitals are provided access to these data through interactive systems, reports, and in-house computers. The stored data are also available to researchers on a contractual basis.

5. Length of stay statistics from this file are published annually in this series of books.

Data Quality

Data quality has always been and remains one of CPHA's major concerns. Although the hospital has basic responsibility for the quality of PAS data, CPHA shares that responsibility in its function as an extension of the hospital's medical information network. CPHA's position of leadership in health information processing systems and data usage necessitates a constant striving for data accuracy.

CPHA goes to considerable length to prevent and correct errors in data submission by training hospital medical record personnel in coding and abstracting methods, by monitoring submitted data, and by meticulously checking and editing the data for errors. Over 350 checks are performed during the processing of each record to ensure the reasonableness of the data received. Examples of discrepancies in the data that are detected by the audit are: hospital day of operative episode exceeding total stay, cesarean section with a normal delivery diagnosis, a sex-specific diagnosis or operation with the wrong sex recorded, incalculable age or stay, unrecorded or invalid diagnosis. When illogical, invalid, or missing data are detected, about 40 percent of the errors are corrected by the computer. The remainder are referred to the hospital staff through error messages generated by the computer.

In addition to the initial data editing, the computer system that produces the length of stay tables does numerous edits to eliminate uncorrected or unusual data. The following events noted on a record cause that record to be excluded:

1. death
2. stillborn
3. admitted from other short-term hospital
4. discharged to other short-term hospital
5. discharged against medical advice
6. length of stay greater than 99 days (included only in the percentile calculations)

These patient records were excluded because they do not represent typical short-term patients. Data that pass all the edits represent patients whose length of stay was solely determined and managed by the physician.

Coverage

Data chosen for inclusion in the length of stay series are from general, nonfederal, short-term hospitals in the United States. Short-term hospitals are defined as those in which the median stay is shorter than 30 days. The map indicates the boundaries of the regional books.

Most of the data used in the length of stay book series are from short-term, general hospitals participating in PAS through CPHA. In addition, the following organizations have sent data to CPHA: Alabama Hospital Association, Colorado Hospital Association, Illinois Hospital Association, Kaiser Foundation Hospitals, Kansas Hospital Association, Maine Hospital Association, Michigan Health Data Corporation, Missouri Health Data Corporation, The National Association of Children's Hospitals and Related Institutions, Inc. (NACHRI), Oregon Hospital Association, Sisters of Mercy Health Corporation (SMHC), Utilization Information Service of the Hospital Association of New York State, and the Vermont Hospital Association. Several individual hospitals throughout the United States have also sent data to CPHA for special studies. These contributed data expand CPHA as a national health information center. The cooperation of these organizations is appreciated.

Hospitals participating in PAS from United States Territories and Puerto Rico were excluded from the series. Data from psychiatric hospitals were excluded because the psychiatric hospitals are not general hospitals. Data from psychiatric units within general hospitals were included. Pediatric hospitals were also included.

Characteristics of all the hospitals with data included in the length of stay books are displayed on the following page.

Organization of Length of Stay Tables

The length of stay tables are organized according to CPHA's cross classification, a patient classification system similar to Diagnosis Related Groups (DRGs). The diagnosis classification system is called *ICD-9-CM List A: Hospital Diagnosis Groups.*[1] Within each procedure group, patients are further stratified by single or multiple diagnoses and age. For diagnosis groups 393-395, which pertain exclusively to newborn, age is replaced by birthweight in grams as a means of stratifying patients. The operated classification system is called *ICD-9-CM List B: Hospital Procedure Groups.* Within each procedure group patients are further stratified by single or multiple diagnoses and age.

Patient data were assigned *ICD-9-CM List A* groups on the basis of the principal diagnosis. This is the diagnosis that after study explains why the patient was admitted to the hospital. Patient data were assigned *ICD-9-CM List B* groups on the basis of the principal procedure. "Principal procedure" is an item in the Uniform Hospital Discharge Data Set (UHDDS)[2] and generally is that therapeutic procedure most related to the principal diagnosis. Diagnosis and procedure information for all patient data included in this book was coded using *ICD-9-CM.*

Definition of Multiple Diagnosis Patients

Patients are classified in the multiple diagnosis category if they had at least one valid secondary diagnosis in addition to the principal. The following codes are not considered valid secondary diagnoses for purposes of this classification:

1) Manifestation codes (conditions that evolved from underlying diseases [etiology] and are in italics in *ICD-9-CM Volume 1*[3])
2) Codes V27.0-V27.9 (outcome of delivery)
3) E codes (external causes of injury and poisoning)

[1] *ICD-9-CM List A: Hospital Diagnosis Groups* and *ICD-9-CM List B: Hospital Procedure Groups* are based on the *International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM),* Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

[2] Additional information regarding UHDDS principal procedure and classes of procedures can be obtained in *UHDDS Classes of Procedures, ICD-9-CM,* Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

[3] *International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM), Volume 1, Diseases: Tabular List,* Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

Definition of Operated Patients

In the diagnosis tables, operated patients are patients who had at least one UHDDS Class 1 procedure. Patients with only Class 2-4 procedures are considered nonoperated. In the procedure tables, operated patients are those whose principal procedure was grouped into an *ICD-9-CM List B* number where at least one UHDDS Class 1 procedure was present. While most *List B* groups contain only Class 1 procedures, the following groups contain Class 1 procedures and at least one procedure that is Class 2-4: 548, 557, 575, 576, 587, 609, 615, 619, 626, 630, 636, 646, 654, 666, 679, 682, 686, 690, 696, 706, 758, 760, 764.

Explanation of Statistics

The *List A* diagnosis group titles and *List B* procedure group titles heading the tables are followed in parenthesis by the *ICD-9-CM* diagnosis or procedure codes included in that *List A* or *List B* group.

Length of stay was calculated by the computer from admission and discharge dates by counting the day of admission but not the day of discharge. Patients discharged on the day of admission were counted as staying one day in the calculation of average stay and variance but as staying less than one day in the calculation of the percentiles. Thus, if more than 5 percent of the patients in a cell (one line of data within a table) were discharged on the day of admission, the 5th percentile is shown as "<1."

Patients who were hospitalized 100 days or longer are not included in Number of Patients, Average Stay, or Variance. The percentiles shown in columns 5 through 11, however, do include these patients.

The variance displayed is an unbiased estimate of the mean squared deviation from the average. For each cell it is calculated as $\sum_{i=1}^{N} (X_i - \overline{X})^2/(N - 1)$, where the X_i's are the length of stay for each patient, $\overline{X}$ is the average stay in the cell, and N is the number of patients in the cell.

The 5th, 10th, 50th, 75th, 90th, 95th, and 99th percentiles of stay are displayed in days. If, for example, the 10th percentile for a group of patients is four, it means that 10 percent of the patients stayed four days or less. The 50th percentile is the median. Any percentile with a value of 100 days or more is listed as 99+.

Determining a stay percentile for a group of patients is done by arranging the individual patient stays from low to high. Counting up from the lowest stay to the point where half of the patients have been counted yields the value of the 50th percentile. Counting off one-tenth of the total patients gives the 10th percentile, and so on.

Defining the Extended Stay Case

Concurrent review of a continuous hospital stay that equals or exceeds the period defined in the hospital's utilization review plan or memorandum of understanding with the utilization review authority is called extended stay review. This review, whether applied universally to all patients within the facility or focused on known or suspected problem areas, is designed to answer the following question: Is further hospitalization medically necessary?

Ideally, this question is posed at that point in the patient's hospitalization which is neither so early as to be annoyingly pointless nor so late that opportunity for cost containment has passed. The median (50th percentile) stay for similar patients, as reflected in current length of stay tables, represents an effort to arrive at a sensible compromise as to the "correct" day on which to initiate the review process.

To satisfy the requirements for extended stay review, a method of defining an extended stay must begin with a definition of factors that affect stay. Presented here is a technique for determining extended stay review dates according to the admitting diagnosis, whether the patient had single or multiple diagnoses, whether the patient had an operation, and the patient's age. In some instances it is appropriate to determine the date for extended stay review by referring to an operation table rather than one based on the diagnosis.

An extended stay review date can be projected for each patient at the time of admission to the hospital by using one of the length of stay books published by CPHA. With the appropriate book, the six steps to determine a review date are as follows:

Step 1. Find the length of stay diagnosis or procedure group (derived from the *ICD-9-CM List A: Hospital Diagnosis Groups* or *ICD-9-CM List B: Hospital Procedure Groups*[1]) that contains the admission diagnosis or principal procedure in one of the following ways:

a. Usually the diagnosis can be found in *Concurrent Review Screening,*[2] developed for admission certification and extended stay review purposes, in which diagnoses are listed alphabetically. The length of stay group for each diagnosis is given in column 4.

b. Diagnoses and procedures can also be found in the Alphabetic Indexes at the back of the length of stay books.

[2] *Concurrent Review Screening—Criteria for Hospital Admission and Assignment of Length of Stay,* Second Edition, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

c. If a diagnosis is not listed in the index to the length of stay tables, the code for the diagnosis can be found in Volume 2 of *ICD-9-CM.*[1] That code can then be located in *List A* or in the heading of the length of stay table. Operated codes can be found in *ICD-9-CM,* Volume 3.

d. If a diagnosis is not clearly specified and therefore might fall into one of several diagnosis groups, the attending physician should be consulted.

Step 2. Find the appropriate table in the length of stay book. The group number precedes the title of each table.

Step 3. Find the appropriate part of the table for single or multiple diagnoses.

Step 4. If surgery is planned, find the applicable section for operated patients. For some diagnoses two or more operations with widely different lengths of stay could be performed, e.g., primary malignancy of trachea, bronchus, and lung, where the planned operation may be either bronchoscopy or a major lung resection. The second edition of *Concurrent Review Screening* directs the UR coordinator to the appropriate operation length of stay table.

Step 5. Determine the patient's age on day of admission and locate the correct age group to find the appropriate cell.

Step 6. Find the 50th percentile of stay for similar patients at the point where the 50th percentile column (column 7) of the table intersects the horizontal line that includes the pertinent variables for the patient having an extended stay review date assigned.

Example: On 3 November a 12 year old patient is admitted to a hospital. The admitting diagnosis is viral pneumonia and no secondary diagnoses are recorded. The following illustrations show the six steps for finding the date on which the patient becomes an extended stay case and must be reviewed.

Step 6. The 50th percentile day is the date assigned for initial extended stay review. Column 7 shows the fourth day after admission to be the day that this patient comes up for extended stay review.

13-19 YRS	44	9.7	54	2	2	8	14	18	23	33

The patient was admitted on 3 November; therefore, the fourth day will fall on 7 November. Prior to or on 7 November, the groups responsible for conducting extended stay review will make a finding as to whether further stay is medically necessary.

In the above example, the stay percentile used to define extended stay was the 50th percentile (column 7). If, based on the initial review, the patient's stay in the hospital was approved for extension beyond the 50th percentile, the date for the second extended stay review is determined in accordance with the hospital's plan, e.g., the 75th percentile.

Subsequent extended stay review dates should be set by the physician advisor or the utilization review committee as necessary based on the patient's medical condition and the attending physician's evaluation of the patient's progress.

Index

Part 1: Diagnosis Index
Part 2: Operation Index

If a diagnosis or operation does not appear in the Index, its corresponding *ICD-9-CM* code can be found in the *International Classification of Diseases, 9th Revision, Clinical Modification,* Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978, Volume 2 Diseases: Alphabetic Index or Volume 3 Procedures: Tabular List and Alphabetic Index. The diagnosis or operation group containing the *ICD-9-CM* code can then be located in the length of stay tables.

DIAGNOSIS INDEX

This diagnosis index lists common diagnoses and gives the number of the *ICD-9-CM* List A diagnosis group to which each diagnosis belongs.
